Lab04 Exercises

❖ Lab04.6. Storing a list of Student without using any Array

Write a program in Java to use only Class/Object concept to store infinite number of student without using Array or Arraylist (*Not allowed to use built-in array anywhere*). Follow the instruction below:

- ✓ Create a **Student** class with at least 5 attributes (id, name, gender, etc.)
- ✓ Create a **StudentList** class with following methods:
  - add (to add to last element of the list)
  - remove (to remove at a specific index)
  - removeLast (to remove last element from the list)
  - clear (to clear all elements from the list)

Usage example:

```java
public static void main(String[] args) {

    StudentList myArr = new StudentList();

    System.out.println("==> Add");
    myArr.add("Makara");
    myArr.add("Kompheak");
    myArr.display();
    System.out.println("\n==> Remove at last");
    myArr.removeLast();
    myArr.add("Minea");
    myArr.add("Mehsa");
    myArr.display();
    System.out.println("\n==> Remove at larger index");
    myArr.remove(10);
    System.out.println("==> Clear all element");
    myArr.clear();
    myArr.display();

}
```

Output

```
==> Add
Makara Kompheak
==> Remove at last
Makara Minea Mehsa
==> Remove at larger index
Index is out of range
==> Clear all element
Array is emply
```
